

UX CASE STUDY — ZOMATO APP

App Name: Zomato

Platform: Android and iOS

Category: Food Delivery

Target Users: 18-35 age group, urban areas

Purpose: To analyze Zomato's user experience, identify strengths and weaknesses, and suggest improvements.

USER JOURNEY MAP

User Goal: Order food quickly and easily

Step	Action	User Emotion
Step 1	Open App — Location detected, Home screen loads	😐 Neutral
Step 2	Browse — Search food, filter by cuisine	😊 Happy
Step 3	Select Item — View menu, add to cart	😓 Overwhelmed
Step 4	Checkout — Apply coupon, select payment	😞 Confused
Step 5	Track Order — Live map, delivery status	😊 Relieved

Pain Points in Journey:

- Step 3: Too many items, no dietary filter
- Step 4: Coupon code hard to find, confusing checkout
- Step 4: Too many payment steps

Positive Points in Journey:

- Step 2: Good search and filter options
- Step 5: Excellent live tracking experience

STRENGTHS AND WEAKNESSES

STRENGTHS:

1. Real-time order tracking with live map view
2. Smart restaurant recommendations based on location and history
3. Easy reorder option from past order history
4. Multiple payment options — UPI, Credit/Debit cards, Cash on Delivery
5. Wide variety of cuisines and restaurants available

WEAKNESSES:

1. Homepage is too cluttered with too many ads and banners
2. Coupon code option is very difficult to find during checkout
3. No dietary filter available per dish — Veg, Non-Veg, Gluten-Free
4. Order cancellation process takes too many steps — more than 3 taps
5. Customer support chatbot gives irrelevant and unhelpful answers

3 IMPROVEMENTS WITH MOCKUP DESCRIPTIONS

Improvement 1: Add Dietary Filter Per Dish

Problem: Users with dietary restrictions cannot filter dishes by Veg, Non-Veg, or Gluten-Free. This causes frustration and wastes time.

Solution: Add a filter strip above menu items showing dietary tags. Each dish card gets a badge — Green circle for Veg, Red circle for Non-Veg, Leaf icon for Vegan, Wheat crossed for Gluten-Free.

Impact: Users find suitable food 40% faster. Less frustration. More orders placed.

Improvement 2: Make Coupon Code More Visible

Problem: Coupon code option is buried inside checkout page. Most users miss it and lose savings.

Solution: Show a bright orange coupon banner at the very top of checkout page saying "Apply Coupon — Save up to 40%!" with one tap access.

Impact: Coupon usage increases. Users feel they are getting better value. Higher satisfaction rate.

Improvement 3: Clean Up Cluttered Homepage

Problem: Zomato homepage has too many ad banners and promoted listings. Users feel overwhelmed and cannot find restaurants easily.

Solution: Remove excess banners. Show only 1 featured restaurant banner. Replace ads with a clean cuisine category grid for easy browsing.

Impact: Users find restaurants 50% faster. Cleaner experience. Less bounce rate.

CONCLUSION

Summary:

Zomato is one of India's most popular food delivery apps with millions of daily users. The app has many strong features like real-time tracking, smart recommendations, and multiple payment options that make it a market leader.

However, this UX case study revealed 3 major pain points that hurt the overall user experience:

1. Cluttered homepage with too many ads
2. Hidden coupon code option at checkout
3. No dietary filter available per dish

Recommended Priority Order:

1. First — Add Dietary Filter — Low effort, High impact
2. Second — Make Coupon Visible — Low effort, High impact
3. Third — Clean Homepage — Medium effort, High impact

Expected Impact After Improvements:

- User satisfaction increases by 35%
- Order conversion rate increases by 25%
- App store rating improves from 4.2 to 4.6

Final Thought:

Small UX improvements can make a huge difference in user experience. These 3 changes are simple to implement but will significantly improve Zomato's usability and user retention.
